Lane and object detection with LiDAR fusion - KITTI 2011_09_26 drive 0013

Single frame from the demo pipeline output

Orange lines	Ego-path corridor edges, bent by the measured yaw rate (always shown)
Green lines / fill	Marking-based lane, drawn only because it agrees with the car's heading (path gate)
Boxes	YOLOv8 + BoT-SORT tracks; label = ID, class, range, source (L = LiDAR, M = monocular)
Box colour	Yellow/red = in the ego path (red if closer than 7 m), the planner reacts to it; green = off path
HUD	Planner state, in-path distance, ego speed, analytic vs learned TTC
Mini-map	Top-down view of the tracked objects relative to the ego vehicle
